

1. DESIGN OF A WATER TANK FOR RURAL AREA

1.1 INTRODUCTION:

Water is the one of most essential natural resources for all form of life. It plays an important role in personal health, agriculture, industry, and environmental balance.

Water tank is the crucial infrastructure components used for storing water for various purpose, for rural area it used for the drinking, cooking, household activities and other activities.

This report focuses on the design of a **circular overhead RCC water tank**.

1.2 MOTIVATION:

In many rural areas, people still struggle to get a supply of clean water. They often depend on rainfall or irregular water deliveries, which means they can run out of water during dry seasons. This makes everyday life difficult — from cooking and cleaning to farming and caring for animals.

Our goal is to create a water tank that is affordable, strong, and easy to build and maintain.

1.3 OBJECTIVE

- To store water for the development of area.
- To provide a clean water in all seasons specially for the dry season.
- To support agricultural activities by supplying water for irrigation.
- To reduce the time and effort required to reach water from distant sources, especially for women and children's.
- To provide emergency water supply in case of firefighting or natural disasters regulate and balance water distribution from the main supply source.

CLOUSE:

In this chapter we study about the uses and importances of water tank. In next chapter we will focus on the various type of tank and its designs as per the area and its demand.
